POWER BI MINI PROJECT

WHOLESALE TRADING & BUSINESS ACCOUNTS ANALYSIS

NAME: JENIFAR JOSEMINA S

COURSE: B.COM FINTECH AND AI

ROLL NO: E25FA014

INTRODUCTION

The Wholesale Trading & Business Accounts Analysis is a Power BI mini-project developed to analyse the financial and operational performance of a wholesale distribution company. The company supplies consumer goods to retailers, institutions, and small businesses across different regions. Its business activities involve managing customer invoices, product sales, payments, discounts, credit transactions, sales returns, and outstanding receivables.

The main purpose of this project is to transform raw business data into meaningful information through interactive dashboards and visualizations. The project focuses on analysing important business indicators such as total sales, gross profit, profit margin, invoices, collections, outstanding receivables, and sales returns. It also provides insights into product performance, customer purchasing behaviour, regional sales performance, and salesperson contributions.

Microsoft Power BI is used to organize, analyse, and visualize the business dataset through KPI cards, charts, tables, and interactive filters. Features such as slicers, drill-down, drill-through, and report page tooltips are incorporated to allow users to explore the data at different levels of detail and obtain relevant information easily.

Overall, this project demonstrates how Power BI can be applied to wholesale business analysis by converting raw transactional data into meaningful business insights. It helps understand financial performance, monitor receivables and collections, evaluate product and customer performance, and support effective business decision-making.

The project also focuses on improving the understanding of business performance through different analytical approaches. It helps examine the relationship between sales revenue, product costs, discounts, and profitability. By analysing invoice details, payment records, and sales returns, the business can better understand its financial activities and identify areas that require attention. This analysis also supports effective monitoring of customer accounts and helps maintain a clear picture of the company's financial operations.

Furthermore, the dashboards are designed to present information in a simple and user-friendly manner, making it easier for users to compare business performance across different categories, regions, customers, and time periods. The interactive features of Power BI provide flexibility in exploring the data and accessing detailed information whenever required. Through this project, practical knowledge of

data modelling, DAX calculations, data visualization, and business intelligence can be developed while understanding their applications in real-world wholesale business

operations.

1.EXECUTIVE SALES OVERVIEW

The Executive Sales Overview dashboard is designed to provide a clear summary of the wholesale company's overall sales and financial performance. It focuses on important business indicators such as total sales, gross profit, gross profit margin, total collections, outstanding receivables, and total invoices.

The dashboard helps management understand how much revenue the business generates, how much profit it earns, how much payment has been collected from customers, and how much amount remains outstanding. It also provides a category-wise and region-wise comparison of sales, along with monthly sales trends.

The dashboard uses KPI cards, bar charts, a line chart, and a date-range slicer to present the information in an organized and interactive format. It helps management quickly identify high-performing product categories, compare regional sales contributions, and observe changes in sales over time.

Key Performance Indicators (KPIs)

The dashboard contains six KPI cards that provide an overview of the company's financial and sales performance.

1. Gross Profit Margin

The Gross Profit Margin KPI displays 19.17%.

Gross Profit Margin represents the percentage of revenue remaining after deducting the cost of goods sold. It indicates how effectively the company manages its product costs in relation to its sales revenue.

A higher gross profit margin generally indicates better control over the cost of goods sold and stronger profitability from sales.

Formula:

Gross Profit Margin = (Gross Profit / Total Sales) × 100

2. Total Collections

The Total Collections KPI displays approximately ₹99.70 million.

It represents the total amount received from customers against their outstanding invoices during the selected period.

Monitoring collections helps the business understand how effectively it receives payments from customers. It also helps evaluate cash inflows and manage working capital requirements.

3. Total Sales

The Total Sales KPI displays approximately ₹132.47 million.

It represents the total sales revenue generated by the wholesale business during the selected period.

This KPI provides an overall view of the company's sales performance and acts as an important measure for comparing product categories, geographical regions, and monthly sales activity.

4. Gross Profit

The Gross Profit KPI displays approximately ₹25.40 million.

Gross Profit represents the amount remaining after deducting the cost of goods sold from total sales.

Formula:

Gross Profit = Total Sales − Cost of Goods Sold

This indicator helps the business understand the profit earned from its sales activities before considering other operating expenses.

5. Outstanding Receivables

The Outstanding Receivables KPI displays approximately ₹32.12 million.

It represents the amount of money that customers still owe the business for goods or services purchased on credit.

Monitoring outstanding receivables is important for managing credit sales and ensuring timely customer payments. A high outstanding balance may require further attention to collection activities and overdue accounts.

6. Total Invoices

The Total Invoices KPI displays approximately 2K invoices.

It represents the total number of invoices recorded during the selected period.

This indicator helps the business understand its billing activity and the volume of sales transactions processed. It also provides a useful reference for analysing customer purchases and payment collections.

Charts and Visualizations

1. Total Sales by Category

A horizontal bar chart is used to compare the total sales generated by different product categories.

The vertical axis represents the product categories, while the horizontal axis represents total sales.

The chart includes six categories:

- Personal Care
- Stationery
- Food & Grocery
- Household
- Apparel
- Electronics

From the visualization, Personal Care generates the highest sales, at approximately ₹32 million. Stationery contributes around ₹24 million, followed by Food & Grocery at approximately ₹22 million. Household and Apparel generate comparatively similar sales, while Electronics records the lowest sales among the displayed categories.

This chart helps the business identify its major revenue-generating product categories. It also supports decisions related to inventory planning, product promotion, and sales strategies.

2. Total Sales by Region Name

A column chart is used to compare the total sales generated across four geographical regions: West, South, North, and East.

The horizontal axis represents the region names, while the vertical axis represents total sales.

The chart indicates that the West region generates the highest sales, at approximately ₹49 million, followed by the South region with around ₹47 million. The North region contributes approximately ₹30 million, while the East region records the lowest sales at around ₹7 million.

This visualization helps management understand the geographical distribution of sales and identify the strongest and weakest performing regions.

The information can support regional business planning, sales target allocation, and decisions regarding future market development.

3. Total Sales by Month

A line chart is used to display the monthly sales trend from January to December.

The horizontal axis represents the months, while the vertical axis represents total sales.

The chart shows that sales begin at approximately ₹7.8 million in January and increase significantly in February and March. March records the highest sales level, at approximately ₹13 million.

After March, sales gradually decrease during the following months, with some fluctuations. Sales increase again around August and November, while the remaining months show moderate variations.

This visualization helps the business understand changes in sales performance throughout the year. It can also help identify periods of higher and lower sales activity.

The monthly trend is useful for sales forecasting, seasonal planning, inventory management, and promotional activities.

4 Slicer and Filter

Full Date Slicer

The dashboard includes a date-range slicer based on the Full_Date field.

The displayed date range is from 01-01-2024 to 31-12-2025.

Users can adjust the date slider or select specific start and end dates to filter the dashboard according to the required period.

This slicer allows management to analyse sales and financial performance over a particular period. For example, users can select a specific month, year, or date range and examine how total sales, gross profit, collections, outstanding receivables, and invoice counts change.

The date slicer also makes it easier to compare business performance across different periods without creating separate dashboards.

---

2. **Product and Discount Analysis**

This dashboard page focuses on analysing product-wise sales performance, discounts, and gross profit. It helps identify the products and categories contributing the most to sales and profitability. It also provides comparisons of discount amounts across categories and examines the relationship between sales and profit across different cities.

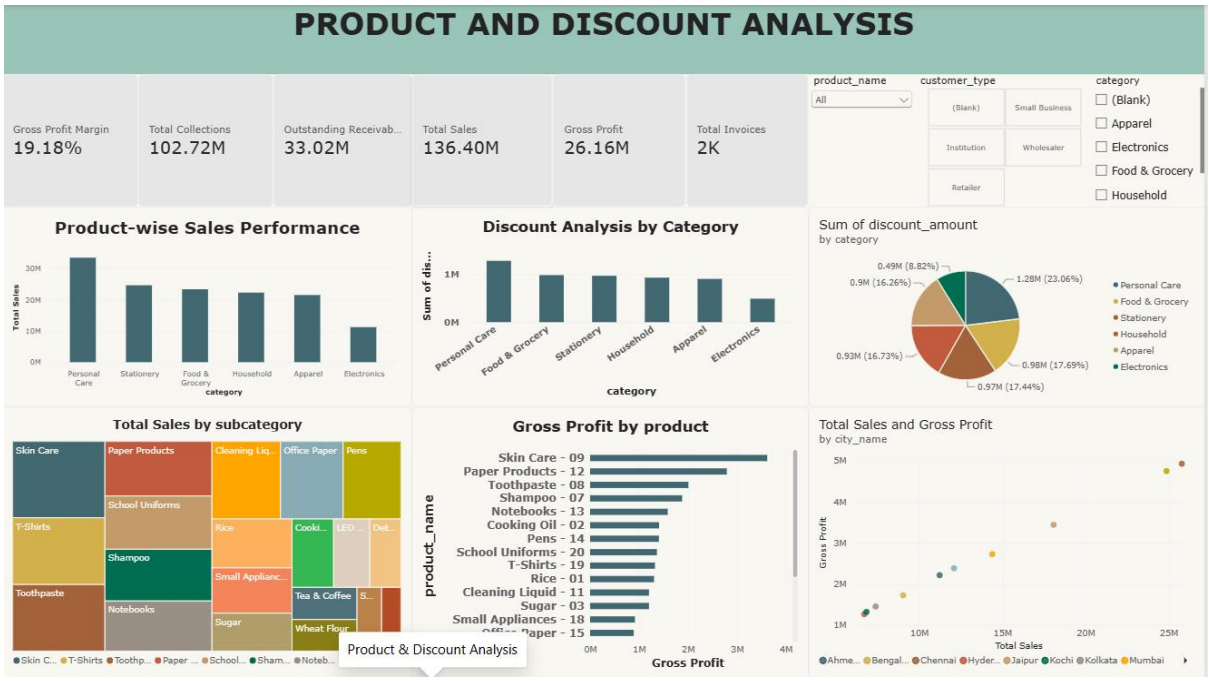

1 KPI Cards

The dashboard contains six KPI cards that provide a summary of the company's financial performance.

1. Gross Profit Margin

The Gross Profit Margin KPI displays 19.18%.

It represents the percentage of sales revenue remaining after deducting the cost of

goods sold. It helps evaluate how effectively the business manages product costs and generates profit from its sales.

2. Total Collections

The Total Collections KPI displays approximately ₹102.72 million.

It represents the total amount received from customers against their invoices. This indicator helps monitor payment collection activities and understand the cash inflows generated by the business.

3. Outstanding Receivables

The Outstanding Receivables KPI displays approximately ₹33.02 million.

It represents the amount customers still owe the business for credit purchases. Monitoring this amount helps the business manage customer payments and identify the need for follow-up on outstanding balances.

4. Total Sales

The Total Sales KPI displays approximately ₹136.40 million.

It represents the total revenue generated from product sales. It provides an overview of the company's sales performance and helps compare the contribution of different products and categories.

5. Gross Profit

The Gross Profit KPI displays approximately ₹26.16 million.

It represents the profit earned after deducting the cost of goods sold from total sales. This indicator helps evaluate the profitability of the company's products and overall sales activities.

6. Total Invoices

The Total Invoices KPI displays approximately 2K invoices.

It represents the total number of invoices recorded in the dataset. It provides an overview of the company's billing activity and the volume of sales transactions processed.

2 Charts and Visualizations

1. Product-wise Sales Performance

A column chart is used to compare total sales across different product categories.

The horizontal axis represents the product categories, while the vertical axis represents total sales.

The categories displayed are Personal Care, Stationery, Food & Grocery, Household, Apparel, and Electronics.

The chart shows that Personal Care generates the highest sales, at approximately ₹33 million. Stationery and Food & Grocery follow with around ₹25 million and ₹23 million respectively. Household and Apparel contribute comparatively lower sales, while Electronics records the lowest sales among the displayed categories.

This visualization helps identify the major revenue-generating product categories. It supports business decisions related to product planning, inventory management, and promotional activities.

2. Discount Analysis by Category

A column chart is used to compare the total discount amount provided across different product categories.

The horizontal axis represents the product categories, while the vertical axis displays the sum of discount amounts.

The chart includes Personal Care, Food & Grocery, Stationery, Household, Apparel, and Electronics.

Personal Care receives the highest total discount, while Electronics receives the lowest discount among the displayed categories. The other categories show relatively similar discount amounts.

This visualization helps the business understand how discounts are distributed across product categories. It also helps evaluate discounting practices and identify categories where promotional offers are more frequently provided.

3. Sum of Discount Amount by Category

A doughnut chart is used to represent the percentage contribution of each product category to the total discount amount.

The chart displays the discount distribution across Personal Care, Food & Grocery, Stationery, Household, Apparel, and Electronics.

Personal Care contributes approximately ₹1.28 million, representing 23.06% of the total discount amount. Food & Grocery contributes around ₹0.98 million (17.69%), while Stationery contributes approximately ₹0.97 million (17.44%).

Household contributes around ₹0.93 million (16.73%), Apparel contributes approximately ₹0.90 million (16.26%), and Electronics contributes around ₹0.49 million (8.82%).

This visualization provides a percentage-based comparison of discounts across categories. It helps the business understand which product categories account for a larger share of the discounts offered.

4. Total Sales by Subcategory

A tree map chart is used to display the distribution of total sales across different product subcategories.

Each rectangular section represents a product subcategory, and the size of the rectangle indicates its relative contribution to total sales.

The chart includes subcategories such as Skin Care, T-Shirts, Toothpaste, Paper Products, School Uniforms, Shampoo, Notebooks, Cleaning Liquid, Office Paper, Pens, Rice, and other products.

The visualization helps identify the subcategories contributing more significantly to sales. Larger rectangles represent subcategories with higher sales values, while smaller rectangles represent those with comparatively lower sales.

This chart makes it easier to compare several product subcategories in a compact visual format and understand the detailed sales distribution within the product categories.

5. Gross Profit by Product

A horizontal bar chart is used to compare gross profit generated by individual products.

The vertical axis represents product names, while the horizontal axis represents gross profit.

The chart displays products such as Skin Care, Paper Products, Toothpaste, Shampoo, Notebooks, Cooking Oil, Pens, School Uniforms, T-Shirts, Rice, Cleaning Liquid, Sugar, Small Appliances, and Office Paper.

Skin Care records the highest gross profit among the products displayed, followed by Paper Products and Toothpaste. Other products contribute varying levels of gross profit.

This visualization helps identify the products that contribute more to the company's profitability. It allows the business to compare individual product performance and make decisions regarding pricing, product promotion, and inventory planning.

6. Total Sales and Gross Profit by City Name

A scatter chart is used to analyse the relationship between total sales and gross profit across different cities.

The horizontal axis represents total sales, while the vertical axis represents gross profit. Each individual point represents a city.

The chart includes cities such as Ahmedabad, Bengaluru, Chennai, Hyderabad, Jaipur, Kochi, Kolkata, and Mumbai.

The position of each point helps compare the sales and profit generated by different cities. Cities positioned further towards the upper-right generally have higher values for both total sales and gross profit.

This visualization helps the business understand the relationship between sales revenue and profitability across geographical locations. It also helps identify cities with stronger sales and profit contributions.

3 Slicers and Filters

The dashboard contains three slicers that allow users to filter the displayed information.

1. Product Name Slicer

The Product Name slicer is provided as a dropdown filter.

It allows users to select a particular product from the available product list. Once a product is selected, the dashboard can display the corresponding sales, discount, and profit information based on the configured visual interactions.

This slicer helps users examine the performance of individual products without manually searching through the entire dataset.

2. Customer Type Slicer

The Customer Type slicer allows users to filter the dashboard according to different customer categories.

The available options shown include Small Business, Institution, Wholesaler, and Retailer, along with a blank category.

This slicer helps analyse product sales and discount information based on the selected customer type. It allows the business to understand which customer groups contribute to sales and how discounts and profitability vary across customer categories.

3. Category Slicer

The Category slicer allows users to select specific product categories.

The displayed categories include Apparel, Electronics, Food & Grocery, and Household, with additional categories available in the list.

By selecting a category, users can focus on the sales and discount performance of that particular product category.

This filter helps compare product categories and understand their contribution to total sales and gross profit.

---

3 .Customer and Receivables

This dashboard page focuses on analysing customer sales, invoice amounts, collections, and outstanding receivables. It helps the business monitor customer payment balances, understand monthly collection trends, and identify customers

contributing significantly to total sales.

Customer and Receivables

1 KPI Cards

The dashboard contains four KPI cards that provide an overview of customer-related financial activities.

1. Total Invoice Amount

The Total Invoice Amount KPI displays approximately ₹136.40 million.

It represents the total value of invoices generated by the business. This indicator helps understand the overall billing amount and the value of sales transactions recorded during the selected period.

2. Total Collections

The Total Collections KPI displays approximately ₹102.72 million.

It represents the total payments received from customers against their invoices. This KPI helps monitor the effectiveness of payment collection activities and understand the amount received by the business.

3. Total Sales

The Total Sales KPI displays approximately ₹136.40 million.

It represents the total revenue generated through product sales. It provides an overall view of sales performance and helps compare sales across different customers and regions.

4. Outstanding Receivables

The Outstanding Receivables KPI displays approximately ₹33.02 million.

It represents the amount that customers still owe the business for credit purchases. Monitoring this amount helps the company identify unpaid balances and manage customer credit effectively.

.2 Charts and Visualizations

1. Customer-wise Outstanding Receivables

A table visual is used to display customer names along with their outstanding receivable amounts.

The table contains a list of customers such as Fresh Choice Mart, Value Plus Retail, A1 Distributors, Classic Traders, New Life Stores, and other customers.

The outstanding receivable values are displayed against each customer. The table helps identify customers with higher unpaid balances and provides a detailed view of the amounts yet to be collected.

This visualization supports customer payment monitoring and helps the business prioritize collection follow-ups.

2. Total Collections by Month

A line chart is used to display the monthly collection trend.

The horizontal axis represents the months, while the vertical axis represents the total collection amount.

The chart shows how customer collections change throughout the year. Collections increase during the initial months, reach a higher level around March, and fluctuate during the remaining months. The trend also shows variations in collection amounts towards the end of the year.

This visualization helps the business understand monthly payment patterns and identify periods with higher or lower collections. It supports cash flow monitoring and collection planning.

3. Outstanding Receivables by Ageing Bucket

A column chart is used to display outstanding receivables based on ageing buckets.

The horizontal axis represents the ageing buckets, while the vertical axis represents the outstanding amount.

The chart mainly displays the 90+ Days ageing bucket and a blank category. The 90+ Days bucket contains a significantly higher outstanding amount compared with the blank category.

This visualization helps the business identify overdue customer balances and understand how long payments have remained unpaid. It is useful for prioritizing older outstanding invoices and improving collection activities.

4. Total Sales by Customer Name

A horizontal bar chart is used to compare the total sales generated by individual customers.

The vertical axis represents customer names, while the horizontal axis represents total sales.

The chart includes customers such as Metro Retail Mart, City Supermarket, Sunrise Enterprises, A1 Distributors, Fresh Choice Mart, Prime Wholesale, and other customers.

Metro Retail Mart records the highest sales among the customers displayed, followed by City Supermarket and Sunrise Enterprises. The remaining customers contribute different levels of sales.

This visualization helps identify major customers and compare their contribution to the company's total revenue. It also supports customer relationship management and sales planning.

3 Slicers and Filters

The dashboard contains four slicers that allow users to filter customer and receivables information.

1. Region Name Slicer

The Region Name slicer is provided as a dropdown filter.

It allows users to select a particular geographical region and analyse the corresponding customer sales, collections, and outstanding receivables.

This filter helps compare customer-related financial performance across different regions.

2. Month Slicer

The Month slicer is provided as a range slider with values from 1 to 12.

It allows users to select a specific month or a range of months for analysis. The dashboard visuals update according to the selected month range.

This slicer helps examine monthly collection trends, customer sales, and outstanding receivables for the selected period.

3. Customer Type Slicer

The Customer Type slicer allows users to filter information based on customer classifications.

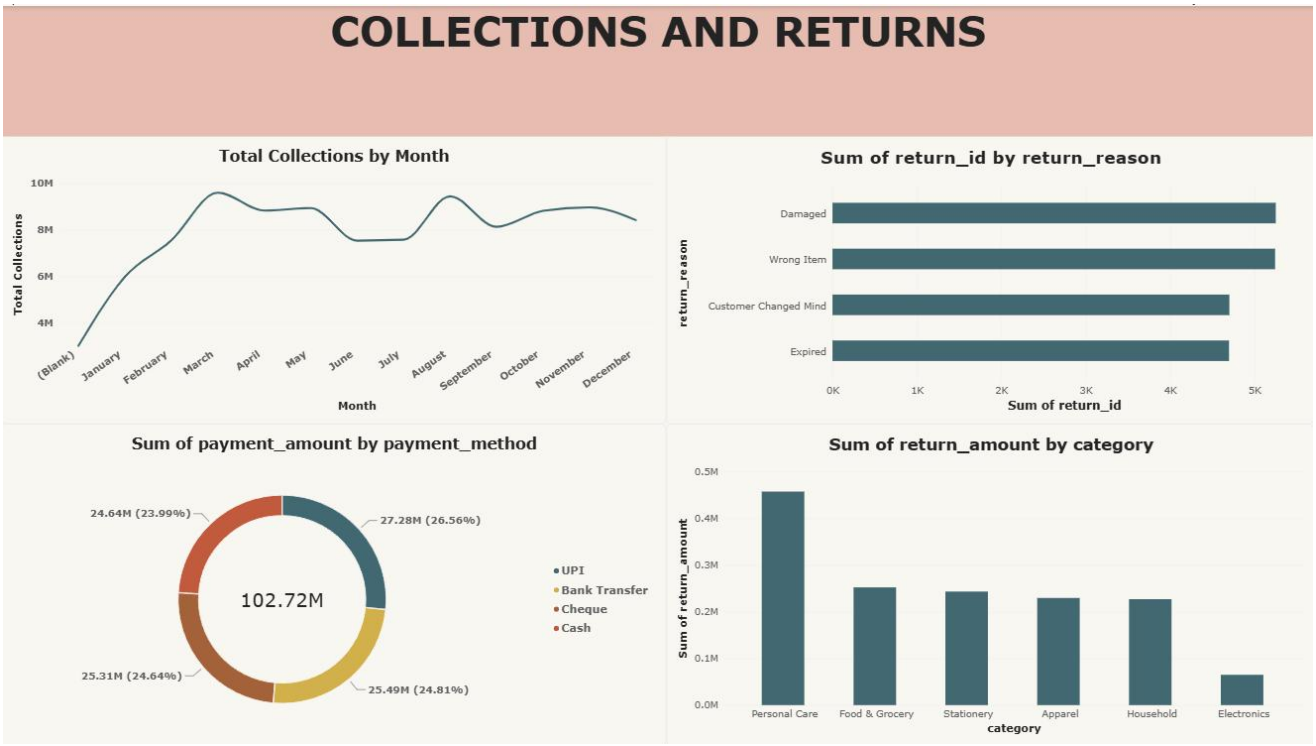

The available options include Institution, Retailer, Small Business, and other displayed categories.

It helps analyse customer sales, collections, and outstanding balances according to the selected customer type.

4. Payment Method Slicer

The Payment Method slicer is displayed using separate selection boxes.

The available payment methods include Bank Transfer, Cheque, Cash, and UPI.

Users can select a payment method to examine the related collection and customer information. This filter helps understand the different payment methods used by customers and analyse collection patterns.

---

4 . Collections and Returns

This dashboard page focuses on analysing customer payment collections and product returns. It presents monthly collection trends, the distribution of payments across different payment methods, return reasons, and return amounts across product categories.

1 Charts and Visualizations

1. Total Collections by Month

A line chart is used to display the monthly trend of total collections throughout the year.

The horizontal axis represents the months, while the vertical axis represents the total collection amount.

The chart shows that collections increase from approximately ₹3 million in January to around ₹9.5 million in March. After March, collections fluctuate, with another increase

during August. The remaining months show moderate variations, with December recording approximately ₹8.4 million.

This visualization helps the business monitor monthly payment collections and identify periods with higher and lower cash inflows. It also supports collection planning and cash flow management.

2. Sum of Return ID by Return Reason

A horizontal bar chart is used to compare the number of return records associated with different return reasons.

The vertical axis represents the return reasons, while the horizontal axis displays the aggregated Return ID values.

The return reasons displayed are:

- Damaged
- Wrong Item
- Customer Changed Mind
- Expired

The chart shows that Damaged and Wrong Item have the highest displayed values, at approximately 5.1K each. Customer Changed Mind and Expired record slightly lower values of approximately 4.7K each.

This visualization helps the business understand the major reasons for product returns. It can help identify recurring issues related to product quality, order accuracy, and customer satisfaction.

3. Sum of Payment Amount by Payment Method

A doughnut chart is used to display the distribution of total payment collections across different payment methods.

The chart includes four payment methods: UPI, Bank Transfer, Cheque, and Cash.

The total payment amount displayed in the centre of the doughnut chart is approximately ₹102.72 million.

The payment distribution is as follows:

- UPI: ₹27.28 million (26.56%)
- Bank Transfer: ₹25.49 million (24.81%)

- Cheque: ₹25.31 million (24.64%)
- Cash: ₹24.64 million (23.99%)

UPI contributes the highest share of collections, followed by Bank Transfer, Cheque, and Cash.

This visualization helps the business understand customer payment preferences and compare the contribution of different payment methods to total collections.

4. Sum of Return Amount by Category

A column chart is used to compare the total return amount across different product categories.

The horizontal axis represents the product categories, while the vertical axis represents the total return amount.

The categories displayed are Personal Care, Food & Grocery, Stationery, Apparel, Household, and Electronics.

Personal Care records the highest return amount at approximately ₹0.46 million. Food & Grocery and Stationery contribute around ₹0.25 million and ₹0.24 million respectively. Apparel and Household show similar return amounts, while Electronics records the lowest return amount at approximately ₹0.06 million.

This visualization helps the business identify the product categories associated with higher return amounts. It supports the evaluation of product quality, return patterns, and areas that may require improvement.

2 KPI Cards

This dashboard page does not contain separate KPI cards. Instead, the total collection amount of approximately ₹102.72 million is displayed at the centre of the doughnut chart as a summary value.

3 Slicers and Filters

No separate slicers or filters are visible on this dashboard page. The four charts present the collection and return information directly without additional slicer controls.

---

5. Branch & Salesperson Performance

This dashboard page focuses on analysing sales performance across different regions, branches, and states. It also provides a salesperson performance ranking based on total sales and gross profit. The visualizations help compare geographical sales contributions and evaluate individual salesperson performance.

1 KPI Cards

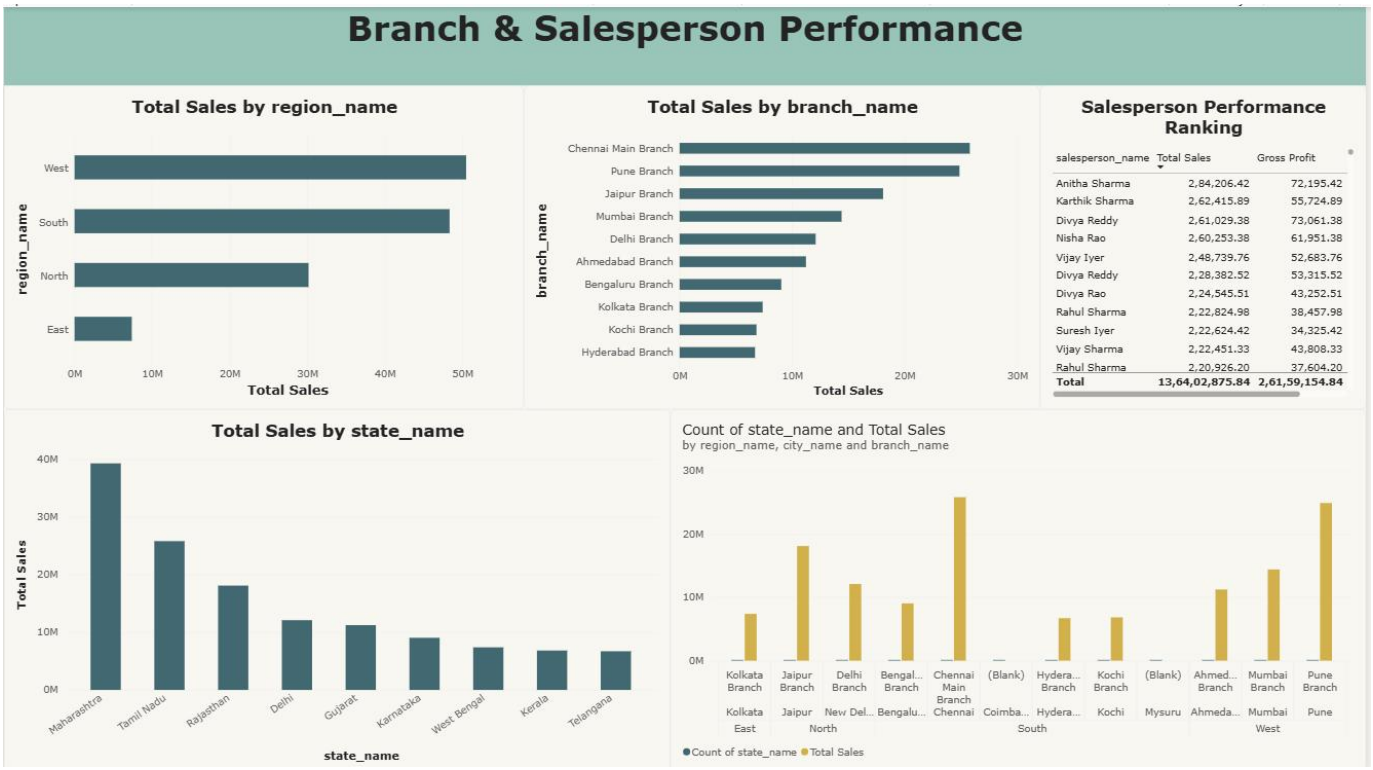

This dashboard page does not contain separate KPI cards. Instead, it presents sales and profit information through charts and a salesperson performance table.

.2 Charts and Visualizations

1. Total Sales by Region Name

A horizontal bar chart is used to compare total sales across four geographical regions: West, South, North, and East.

The vertical axis represents the region names, while the horizontal axis represents total sales.

The chart shows that the West region generates the highest sales, at approximately ₹49 million, followed closely by the South region with around ₹48 million. The North

region contributes approximately ₹30 million, while the East region records the lowest sales at around ₹7 million.

This visualization helps identify the regions contributing the most to the company's total sales. It also supports regional performance comparisons and business planning.

2. Total Sales by Branch Name

A horizontal bar chart is used to compare the total sales generated by different branches.

The vertical axis represents the branch names, while the horizontal axis represents total sales.

The chart includes Chennai Main Branch, Pune Branch, Jaipur Branch, Mumbai Branch, Delhi Branch, Ahmedabad Branch, Bengaluru Branch, Kolkata Branch, Kochi Branch, and Hyderabad Branch.

Chennai Main Branch records the highest sales, followed by Pune Branch and Jaipur Branch. Mumbai and Delhi branches also contribute significantly, while Hyderabad Branch records comparatively lower sales among the displayed branches.

This visualization helps management evaluate individual branch performance and identify branches generating higher and lower sales. It can support branch-level planning and the allocation of business resources.

3. Salesperson Performance Ranking

A table visual is used to display and compare the performance of individual salespersons.

The table contains three columns:

- Salesperson Name
- Total Sales
- Gross Profit

It displays salesperson names such as Anitha Sharma, Karthik Sharma, Divya Reddy, Nisha Rao, Vijay Iyer, Divya Rao, and Rahul Sharma.

The table provides a detailed comparison of the total sales and gross profit generated by each salesperson. It helps identify employees contributing significantly to the company's sales and profitability.

This visualization supports performance evaluation, employee recognition, and the identification of salespersons who may require additional training or support.

4. Total Sales by State Name

A column chart is used to compare total sales across different states.

The horizontal axis represents the state names, while the vertical axis represents total sales.

The chart includes Maharashtra, Tamil Nadu, Rajasthan, Delhi, Gujarat, Karnataka, West Bengal, Kerala, and Telangana.

Maharashtra records the highest sales at approximately ₹39 million, followed by Tamil Nadu with around ₹26 million and Rajasthan with approximately ₹18 million. Delhi and Gujarat contribute moderate sales, while the remaining states record comparatively lower sales.

This visualization helps the business understand the geographical distribution of sales across states. It also helps identify stronger markets and regions where additional sales efforts may be required.

5. Count of State Name and Total Sales by Region, City, and Branch Name

A clustered column chart is used to display the count of state names and total sales across different geographical levels, including regions, cities, and branches.

The chart uses region name, city name, and branch name as its geographical categories. It compares two measures: the count of state names and total sales.

The visualization provides a hierarchical view of sales distribution across geographical locations. It allows users to compare sales contributions at different levels, from regions to individual branches.

This chart helps management understand how sales are distributed across different locations and compare the performance of branches within their respective regions.

3 Slicers and Filters

No separate slicers or filters are visible on this dashboard page. The information is presented through the five charts and table, allowing users to compare regional, state-wise, branch-wise, and salesperson performance.

Purpose of the Tooltip

The tooltip provides additional business information without occupying space on the main dashboard. When users hover over a visual to which the tooltip is assigned, these four KPI cards provide a quick overview of sales volume and profitability.

This improves dashboard interactivity and allows users to access important performance indicators conveniently.

Conclusion

The Wholesale Trading & Business Accounts Analysis project demonstrates the practical application of Microsoft Power BI in analysing the financial and operational performance of a wholesale distribution company. The five interactive dashboard pages provide a comprehensive view of sales performance, product and discount analysis, customer accounts, outstanding receivables, collections, returns, branch performance, and salesperson contributions.

The use of KPI cards, charts, tables, and slicers makes complex business information easier to understand and compare. Additional features such as drill-down, drill-through, and report page tooltips improve the interactivity of the dashboards and allow users to explore information at different levels of detail.

Through this project, practical knowledge of data cleaning, data modelling, DAX calculations, and data visualization has been developed. It also provides an understanding of how business intelligence tools can transform raw transactional data into meaningful insights.

Overall, the project highlights how Power BI supports effective business analysis, financial monitoring, performance evaluation, and informed decision-making in wholesale trading operations.
